About this kit

This section covers the following topics:

● Purpose of the kit (page 8)
● Kit contents (page 10)
● Storage and safe handling (page 13)
Purpose of the kit

Uses of the kit

The BD™ Human Pluripotent Stem Cell Transcription Factor Analysis Kit (Catalog No. 560589) provides the reagents necessary to perform multicolor flow cytometry on human embryonic stem cells (hESCs) and induced pluripotent stem (iPS) cells.

This kit can be used to analyze cells for expression of intracellular pluripotency markers. We also designed this kit to give you the option to add additional antibodies (for some surface or intracellular markers) that fluoresce in any open channel (for example, the FITC channel), or to analyze cells expressing green fluorescent protein (GFP).

Specific antibodies

Human pluripotent stem cells are characterized by the expression of specific intracellular transcription factors.1,2 The BD Human Pluripotent Stem Cell Transcription Factor Analysis Kit contains three fluorochrome-conjugated antibodies that distinguish and identify human pluripotent cells. The three conjugated antibodies included in this kit (Nanog, Oct3/4 [or POU5F1], and Sox2) recognize transcription factors that are expressed in human pluripotent stem cells and have been termed the “core” pluripotency factors in hESCs.3-5 This combination of markers has been widely used to characterize hESCs and iPS cells.2,6,7

Isotype-control antibodies

This kit contains three isotype controls. Each isotype control is a non-specific antibody that is conjugated to the same fluorochrome as one of the specific antibodies, and is bottled at the same concentration as the specific antibodies.
The isotype controls are used to identify any non-specific (background) staining of the specific antibodies in the BD Human Pluripotent Stem Cell Transcription Factor Analysis Kit.

This kit has been tested on human H9 and H7 (WiCell, Madison, WI) embryonic stem cell lines, and no problematic background staining has been observed.

Control beads

This kit also contains BD™ CompBead Plus positive and negative beads to facilitate application setup for analysis of stained cells.

The positive beads are coated with antibodies that will bind to one of the specific antibodies in this kit. The negative beads have no binding capacity.

Once the beads have been stained with the specific antibodies, they provide distinct positive and negative populations that assist in optimizing photomultiplier tube (PMT) settings and calculating fluorescence compensation. Use of these beads ensures consistent application setup and conserves cells.

Use of other antibodies

The reagents in this kit and the methods described in this manual are compatible with the use of additional fluorochrome-conjugated antibodies specific to other cellular molecules (for example, surface antigens, transcription factors, cytokines, etc).

For more information about this option, see Drop-in conjugates (page 39).
Kit contents

The BD Human Pluripotent Stem Cell Transcription Factor Analysis Kit contains the following reagents.

<table>
<thead>

**Quantity:** 1 vial (6.0 mL) |
| BD Cytofix™ fixation buffer | **Use:** To fix cells  
**Quantity:** 1 bottle (50 mL) |
| BD Perm/Wash™ buffer (10X) | **Use:** To permeabilize and wash cells  
**Quantity:** 1 bottle (60 mL) |

**Serum proteins**

Components in this kit contain a small percentage of serum proteins. Source of all serum proteins is from USDA-inspected abattoirs located in the United States.

---

For Research Use Only. Not for use in diagnostic or therapeutic procedures.
Storage and safe handling

**Storage**

The entire BD Human Pluripotent Stem Cell Transcription Factor Analysis Kit must be stored in the dark at 2° to 8°C. Do not freeze.

**Warning**

*Danger*

BD Cytofix™ Fixation Buffer (component 51-9006276) contains 4.2% formaldehyde (w/w).

**Hazard statements**

*Harmful if inhaled.*

*Causes skin irritation.*

*Causes serious eye damage.*

*May cause an allergic skin reaction.*

*Suspected of causing genetic defects.*

*May cause cancer. Route of exposure: Inhalative.*

*May cause respiratory irritation.*

**Precautionary statements**

*Wear protective clothing / eye protection.*

*Wear protective gloves.*

*Do not breathe mist/vapours/spray.*

*IF IN EYES: Rinse cautiously with water for several minutes. Remove contact lenses, if present and easy to do.*

*Continue rinsing.*
If skin irritation or rash occurs: Get medical advice/attention.

The reagents in this kit contain sodium azide. Sodium azide yields highly toxic hydrazoic acid under acidic conditions. Dilute azide compounds in running water before discarding to avoid accumulation of potentially explosive deposits in plumbing.
Before you begin

This section covers the following topics:

- Workflow overview (page 16)
- Required materials (page 17)
- Common cell-preparation techniques (page 18)
Workflow overview

Workflow

Following is an overview of the steps involved in using the BD Human Pluripotent Stem Cell Transcription Factor Analysis Kit to analyze cells.

1. Perform flow cytometer QC
2. Obtain a single-cell suspension in PBS
3. Fix the cells at 1 x 10⁷ cells per mL in BD Cytofix fixation buffer for 20 minutes at RT then wash 2x in Perm/Wash buffer
4. Permeabilize the cells at 1 x 10⁷ cells per mL in BD Perm/Wash buffer for 10 minutes at RT
5. Stain the cells use 5 x 10⁵ to 1 x 10⁶ cells per sample at 1 x 10⁷ cells per mL in BD Perm/Wash buffer
   - unstained cells
   - cells + all 3 specific antibodies
   - cells + all 3 isotype controls
   - negB + αmb + any drop-in conjugates (negB = negative beads)
   - αmb = anti-mouse beads
6. Stain the beads in BD Perm/Wash buffer for 30 minutes at RT then wash 2x in Perm/Wash buffer then resuspend in 300-400 μL of stain buffer (cells at 1 to 3 x 10⁶ cells per mL)
7. Run the beads to adjust scatter and fluorescence settings, create application settings, and calculate compensation
8. Set up the workspace to create tubes, labels, plots, and histograms
9. Run the unstained cells to fine-tune scatter settings and gate on cells
10. Record data from the unstained cells to measure autofluorescence
    - from the isotype control cells to measure background staining
    - from the specific-stained cells to distinguish pluripotent from differentiated cells

For Research Use Only. Not for use in diagnostic or therapeutic procedures.
Required materials

The following reagents, consumables, and equipment are required for use with the BD Human Pluripotent Stem Cell Transcription Factor Analysis Kit:

- 1X PBS without Ca\(^{2+}\) or Mg\(^{2+}\)
- Accutase\textsuperscript{TM} Enzyme Cell Detachment Medium from Innovative Cell Technologies, or equivalent (if analyzing hESCs)
- Microscope for confirming a single-cell suspension
- Falcon\textsuperscript{®} 70-µm cell strainer (Catalog No. 352350), or equivalent (optional, but recommended)
- Hemocytometer or other cell counter
- Deionized water, or equivalent
- BD Pharmingen\textsuperscript{TM} stain buffer (FBS) (Catalog No. 554656), or equivalent
- Falcon\textsuperscript{®} round-bottom 12 x 75-mm polystyrene tubes with caps (Catalog No. 352058), or equivalent
- BD\textsuperscript{TM} LSR II flow cytometer, BD FACSCanto\textsuperscript{TM} II flow cytometer, BD FACSCalibur\textsuperscript{TM} flow cytometer, or other flow cytometer equipped with a blue (488-nm) laser, a red (633-nm) laser, and detectors for PE, PerCP-Cy5.5, and Alexa Fluor\textsuperscript{®} 647
Common cell-preparation techniques

Washing cells  Several of the procedures in this manual instruct you to wash the cell suspension.

To wash cells:
1. Add the specified volume of buffer.
2. Centrifuge for 5 minutes at the specified speed.
   Note: Centrifuge cells at 300g before they are fixed, and at 500g after they are fixed.
3. Aspirate the supernatant, being careful not to disturb the cells.
4. Resuspend as directed.

Adjusting cell concentration  After harvesting cells from culture, each of your samples will have a unique cell concentration. Several of the procedures in this manual require that you adjust your cell suspension to a specific cell concentration.

To adjust the cell concentration for each sample:
1. Determine the current cell concentration using the standard method for your hemocytometer or other cell counter.
2. Calculate the volume that would result in the required concentration (for example, 1 x 10^7 cells per mL).
   This is your target volume.
3. Adjust the concentration to achieve the target volume.
   If your cell suspension is too concentrated, add the appropriate buffer to bring the total volume up to the target volume.

For Research Use Only. Not for use in diagnostic or therapeutic procedures.
If your cell suspension is too dilute:

a. Centrifuge the cells for 5 minutes at 300g (for unfixed cells) or 500g (for fixed cells).

b. Aspirate the supernatant, being careful not to disturb the cells.

c. Resuspend in the target volume of the appropriate buffer.

For example, for 3 million cells, the target volume would be 300 µL to obtain a concentration of $1 \times 10^7$ cells per mL.
3

Preparing cells and beads

This section covers the following topics:

- Obtaining a single-cell suspension (page 22)
- Fixing the cells (page 24)
- Permeabilizing the cells (page 25)
- Staining (page 26)
Obtaining a single-cell suspension

Before you begin  Ensure that you have all of the necessary materials available. See Required materials (page 17) for details.

As a detachment enzyme, we recommend using Accutase for analyzing hESCs.

Ensure that the 1X PBS without Ca\(^{2+}\) or Mg\(^{2+}\) is at room temperature.

Procedure  To obtain a single-cell suspension:

1. Wash the cells with room-temperature PBS.
2. Add the detachment enzyme to the cells at the concentration recommended by the manufacturer.
3. Incubate at the recommended temperature and for the recommended duration.
4. If required, neutralize the enzyme.
5. Pipette the cells gently up and down.
6. Remove a small subset of the liquid and check it under a microscope to confirm the presence of single cells.
7. If you observe clumps of cells, collect the cell suspension and pass it through a 70-µm cell strainer.
8. Wash the cells in two to four volumes of PBS (centrifuging at 300g for 5 minutes).
9. Resuspend the cells in a volume of PBS that is appropriate for cell counting (for example, 5 mL of PBS for one confluent 6-well culture dish).
10. Determine the cell concentration and total number of cells per sample using the standard method for your hemocytometer or other cell counter.

For Research Use Only. Not for use in diagnostic or therapeutic procedures.
Guidelines for number of cells

Your research needs will determine how many cells you need for staining, depending upon the number of controls you decide to run.

For each cell type you will be analyzing, we recommend that you run a sample of unstained cells to measure autofluorescence, and an isotype control to measure non-specific staining. See Staining (page 26) for more information about isotype controls.

Refer to the following guidelines.

<table>
<thead>
<tr>
<th>Guideline</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Required cell concentration for staining</td>
<td>$1 \times 10^7$ cells/mL</td>
</tr>
<tr>
<td>Recommended cells per tube for staining</td>
<td>$1 \times 10^6$ cells</td>
</tr>
<tr>
<td>Minimum cells per tube for staining</td>
<td>$5 \times 10^5$ cells</td>
</tr>
<tr>
<td>Recommended volume of cells per tube at the required concentration</td>
<td>100 µL</td>
</tr>
<tr>
<td>Minimum volume of cells per tube at the required concentration</td>
<td>50 µL</td>
</tr>
</tbody>
</table>

Next step

Proceed immediately to Fixing the cells (page 24) unless you are adding a drop-in conjugate before fixing. See Adding drop-in conjugates (page 40) for more information about this option.
Fixing the cells

Before you begin  Complete the steps in Obtaining a single-cell suspension (page 22).

Decide whether you will need to store the fixed cells. For best results, we recommend that you plan to stain and acquire samples within 24 to 48 hours of fixing.

Procedure  To fix the cells:

1. Centrifuge cells at 300g for 5 minutes, and aspirate to remove the supernatant.
2. Gently add BD Cytofix fixation buffer to bring to 1 x 10^7 cells per mL.
3. Incubate for 20 minutes at room temperature.
4. Proceed as follows.

<table>
<thead>
<tr>
<th>If you will...</th>
<th>Then...</th>
</tr>
</thead>
<tbody>
<tr>
<td>Stain cells the same day</td>
<td>Proceed immediately to Permeabilizing the cells (page 25)</td>
</tr>
<tr>
<td>Store the fixed cells</td>
<td>1. Wash the cells twice in two to four volumes of PBS (centrifuging at 500g for 5 minutes).&lt;br&gt;2. Resuspend in PBS at 1 x 10^7 cells per mL.&lt;br&gt;3. Store at 4°C for 24 to 48 hours.&lt;br&gt;4. Proceed to Permeabilizing the cells (page 25).</td>
</tr>
</tbody>
</table>
Permeabilizing the cells

Before you begin  Complete the steps in Fixing the cells (page 24).

Prepare 1X BD Perm/Wash buffer by diluting the 10X BD Perm/Wash buffer in deionized water. You will need approximately 4.5 to 5.0 mL of 1X Perm/Wash buffer per one million cells, plus 2.1 mL for each bead tube (each experiment has at least four bead tubes, plus one for each drop-in conjugate).

Note: If you are co-staining with surface markers, we do not recommend the use of methanol-based perm buffers.

Procedure  To permeabilize the cells:

1. Wash cells twice in approximately 1 mL of 1X BD Perm/Wash buffer for each $1 \times 10^7$ cells (centrifuging at 500g for 5 minutes).

2. Resuspend the cells in 1X BD Perm/Wash buffer at $1 \times 10^7$ cells per mL.

3. Incubate for 10 minutes at room temperature.

Next step  Proceed immediately to Staining (page 26). Permeabilized cells cannot be stored and must be stained immediately.
Staining

**Before you begin** Complete the steps in Permeabilizing the cells (page 25).

We recommend setting aside a sample of unstained cells to measure autofluorescence for each cell type.

To prepare unstained cells, add 100 µL of permeabilized cells (1 x 10⁶ cells) to a labeled 12 x 75-mm polystyrene tube and place the tube in the dark at room temperature.

**Isotype controls** We recommend setting up an isotype control to test for non-specific staining each time you test the kit on a new cell line. Once you have determined the background for a particular cell type, the use of isotype controls is optional.

This kit has been tested on H9 and H7 hESC lines and no problematic background staining has been observed.
Procedure

To stain cells and beads:

1. For each of your cell types, label one 12 x 75-mm polystyrene tube “specific stain” and one tube “isotype control” (if applicable).

2. Add the following to each tube.

<table>
<thead>
<tr>
<th>Component</th>
<th>Volume to add to tube labeled</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>Specific stain</td>
</tr>
<tr>
<td>Permeabilized cells</td>
<td>100 µL (1 x 10⁶ cells)</td>
</tr>
<tr>
<td>PE hNanog</td>
<td>20 µL</td>
</tr>
<tr>
<td>PerCP-Cy5.5 Oct3/4</td>
<td>20 µL</td>
</tr>
<tr>
<td>Alexa Fluor® 647 Sox2</td>
<td>20 µL</td>
</tr>
<tr>
<td>PE isotype control</td>
<td>—</td>
</tr>
<tr>
<td>PerCP-Cy5.5 isotype control</td>
<td>—</td>
</tr>
<tr>
<td>Alexa Fluor® 647 isotype control</td>
<td>—</td>
</tr>
</tbody>
</table>

If you are adding additional antibodies at this stage, see Adding drop-in conjugates (page 40).

3. Mix the tubes gently and incubate at room temperature in the dark for 30 minutes.

4. Immediately after starting the cell-stain incubation, label four 12 x 75-mm polystyrene tubes for the beads as follows:
   - Negative
   - PE
   - PerCP-Cy5.5
   - Alexa 647

Note: If you stained the cells with additional fluorochrome-conjugated antibodies, prepare stained beads for those antibodies as well so that...
you can calculate compensation for all relevant fluorochromes.

5. Add the following to each tube in the order shown (vortex the beads thoroughly immediately before dispensing drops).

<table>
<thead>
<tr>
<th>Component</th>
<th>Volume to add to the tube labeled</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>Negative</td>
</tr>
<tr>
<td>Perm/Wash buffer (1X)</td>
<td>100 µL</td>
</tr>
<tr>
<td>Negative beads</td>
<td>1 drop</td>
</tr>
<tr>
<td>Anti-mouse beads</td>
<td>—</td>
</tr>
<tr>
<td>PE hNanog</td>
<td>—</td>
</tr>
<tr>
<td>PerCP-Cy5.5 Oct3/4</td>
<td>—</td>
</tr>
<tr>
<td>Alexa Fluor® 647 Sox2</td>
<td>—</td>
</tr>
</tbody>
</table>

6. Vortex the tubes and incubate at room temperature in the dark for 30 minutes.

7. After the 30-minute incubation is complete for both the cells and the beads, wash each tube twice in 1 mL of 1X Perm/Wash buffer (centrifuging at 500g for 5 minutes).

8. Resuspend the cells and beads in 300 to 400 µL of BD Pharmingen stain buffer (FBS).

   Resuspend the cells at a concentration between 1 x 10⁶ cells per mL and 3 x 10⁶ cells per mL.

---

Next step

 Proceed to Running the beads (page 30).

Storage is not recommended. Run stained beads and cells within 1 to 2 hours of staining.
Cytometer procedures

This section provides guidelines for application setup and data acquisition for analysis of cells stained with the BD Human Pluripotent Stem Cell Transcription Factor Analysis Kit.

The guidelines and examples in this section use BD FACSDiva™ software and BD FACSTM flow cytometers. However, the fundamental approach to setup and acquisition can be adapted for research labs with other flow cytometers.

This section covers the following topics:

- Running the beads (page 30)
- Setting up the workspace for running cells (page 34)
- Running the cells (page 36)
- Template examples (page 37)
Running the beads

Purpose of the procedure

The stained beads are run for two purposes:

- To adjust the forward scatter (FSC), side scatter (SSC), and fluorescence settings so that hESCs or iPS cells will be on scale (this minimizes the adjustments you will have to make later, thereby preserving stained cells).

- To calculate compensation.

If you are using this kit for the first time on a new cell type, running the beads establishes application settings that can be saved for future use. If you already have saved application settings, running the beads confirms these settings.

Before you begin

Ensure that your instrument configuration is appropriate for this assay. If necessary, add Alexa Fluor® 647 as a parameter. Alternatively, you can use the APC detector to detect Alexa Fluor® 647.

Ensure that you run the appropriate instrument setup and QC procedures for your flow cytometer. See your user’s guide for more information.

Complete the steps in Preparing cells and beads (page 21).
To run the prepared control beads:

1. Create a new experiment in BD FACSDiva software.

2. If you have saved application settings for use with this kit, apply the application settings.

3. Delete all parameters except FSC, SSC, PE, PerCP-Cy5.5, and Alexa Fluor® 647. If you stained the cells with additional conjugates, include all relevant fluorescence parameters.

Note: The voltage settings that appear in this window will vary with each instrument.

5. Create a statistics view in the Unstained Control worksheet to display the FSC mean and SSC mean for the P1 population.

6. Place the tube of unstained (negative) beads on the cytometer and begin acquisition.
7. Set the P1 gate around the singlet bead population.

8. Adjust the FSC and SSC photomultiplier tube (PMT) voltages to obtain the following values.

<table>
<thead>
<tr>
<th>Cell type</th>
<th>Parameter</th>
<th>Mean of bead population</th>
</tr>
</thead>
<tbody>
<tr>
<td>hESCs</td>
<td>FSC-A</td>
<td>10,000 to 20,000</td>
</tr>
<tr>
<td>hESCs</td>
<td>SSC-A</td>
<td>90,000 to 115,000</td>
</tr>
</tbody>
</table>

Note: Adjusting the voltages to obtain these values should place the stem cells on scale.

9. Place each of the stained compensation control tubes on the cytometer in turn, and adjust the PMT voltages as follows.

<table>
<thead>
<tr>
<th>Adjust the PMT voltage for...</th>
<th>Until the mean of the positive population is...</th>
</tr>
</thead>
<tbody>
<tr>
<td>PE</td>
<td>Between $10^4$ and $10^5$</td>
</tr>
<tr>
<td>PerCP-Cy5.5</td>
<td>Between $10^4$ and $10^5$</td>
</tr>
<tr>
<td>Alexa Fluor® 647</td>
<td>Between $10^4$ and $10^5$</td>
</tr>
</tbody>
</table>

10. Reinstall the tube of unstained beads and record data.
11. Record data for the remaining compensation control tubes. Make sure to adjust the P2 gates to fit the positive populations.

![Compensation Controls-Alexa 647 Stained Control](image)

12. If you have not already done so, save the application settings for future use.
   a. In the **Browser**, right-click **Cytometer Settings** and select **Application Settings > Save**.
   b. Name the application, then click **OK**.

13. Calculate compensation.
   a. From the **Experiment** menu, select **Compensation Setup > Calculate Compensation**.
   b. Name the compensation setup, then click **Link and Save**.

**Next step**
Proceed to **Setting up the workspace for running cells** (page 34).
Setting up the workspace for running cells

Before you begin  Complete the steps in Running the beads (page 30).

Check your cytometer configuration. If your cytometer configuration is not set up for Alexa Fluor® 647, use the APC parameter instead.

Procedure  To set up the workspace for running cells:
1. Create a new specimen in BD FACSDiva software.
2. Create tubes and label them appropriately for the unstained cells, isotype-control cells, and specific-stained cells.
3. If you have previously saved a template for use with this kit, import it and proceed directly to Running the cells (page 36).
4. In the Labels tab of the Experiment Layout window, enter parameter labels for each marker in the experiment, including any drop-in conjugates.

For Research Use Only. Not for use in diagnostic or therapeutic procedures.
5. On a global worksheet, create the following plots (we recommend acquiring data with dot plots and analyzing data with contour plots):
   - FSC-A vs SSC-A
   - PE-A vs PerCP-Cy5.5-A
   - Alexa Fluor® 647-A vs PerCP-Cy5.5-A
   - PE-A vs Alexa Fluor® 647-A

6. Create the following histograms:
   - PE-A
   - PerCP-Cy5.5-A
   - Alexa Fluor® 647-A

7. Select biexponential scaling for all fluorochrome axes.

8. Save this worksheet as a template for use in future experiments.

---

**Next step**

Proceed to **Running the cells** (page 36).

Running the cells

Before you begin  Complete the steps in Setting up the workspace for running cells (page 34).

Procedure  To run the cells:

1. Place the tube of unstained cells on the cytometer and begin acquiring.

2. Adjust the FSC and SSC PMT voltages as needed to ensure that the cell population appears on scale in the scatter plot.

   **Note:** Do not adjust the fluorescence settings at this stage. Adjusting the fluorescence settings now will invalidate the compensation calculations.

3. Create a P1 gate on the population in the FSC-A vs SSC-A plot.

   **Note:** We recommend using a cluster-based approach for analyzing multicolor data, although single-parameter analysis can also be used.

4. Record data from the unstained cells.

5. Place the isotype control tube on the flow cytometer and record data.

6. Place the specific-stained cells on the cytometer and record data.
Template examples

Example with isotype-control hESCs

The following is an example of an analysis template showing isotype-control data from undifferentiated hESCs from the H9 cell line.
Example with specific-stained hESCs

The following is an example of an analysis template showing data from specific-stained undifferentiated hESCs from the H9 cell line.

Drop-in conjugates

This section covers the following topics:

- Adding drop-in conjugates (page 40)
- Examples of data with drop-in conjugates (page 42)
Adding drop-in conjugates

Purpose of adding drop-ins
This topic provides information about adding “drop-in” conjugates: staining cells with fluorochrome-conjugated antibodies in addition to those provided in the kit. To obtain more information about the cells, you may decide to add antibody conjugates to surface or intracellular markers not already recognized by the antibodies in the BD Human Pluripotent Stem Cell Transcription Factor Analysis Kit.

Criteria for conjugate choice
Ensure that:

- The drop-in conjugate will fluoresce in an open channel (for example, the FITC channel), and your flow cytometer is equipped with the appropriate detector.
- The drop-in conjugate has a Mouse Ig, κ isotype so that the anti-mouse beads provided with this kit can be used for compensation.
- You know the optimal concentration for the drop-in conjugate and have calculated the correct amount of antibody to add to the sample tubes.

When to add drop-ins
If you can confirm that the drop-in will appropriately stain cells that have been fixed and permeabilized, simply add the correct amount of antibody along with the kit antibodies as described in Staining (page 26).

If the drop-in conjugate recognizes a surface marker and will not work with fixed and permeabilized cells, try the following steps:

1. Stain live cells with the antibody for 20 to 30 minutes.
2. Wash the cells twice in PBS.
3. Fix, permeabilize, and stain the cells with the rest of the antibodies in the kit as described in Preparing cells and beads (page 21).

**Isotype controls**

When using drop-in conjugates, we recommend using fluorescence minus one (FMO) controls to reveal any non-specific binding that either the additional antibody or the fluorochrome on this antibody might have with the kit antibodies.

To create an FMO control, include a tube of cells in which you add the three kit antibodies (PE hNanog, PerCP-Cy5.5 Oct3/4, and Alexa Fluor® 647 Sox2) plus the matched isotype of the drop-in.

**Compensation**

When staining beads, ensure that you prepare an additional tube for calculating compensation for the fluorochrome of each drop-in conjugate.

When creating a new experiment, ensure that you include all relevant fluorescence parameters, and calculate compensation for all tubes.
Examples of data with drop-in conjugates

Example of FMO control for SSEA-4 drop-in on undifferentiated H9s

The following is an example of an analysis template showing data from human H9 ES stained with the kit antibodies plus mlgG3 FITC (the matching isotype for FITC anti-SSEA-4).

For Research Use Only. Not for use in diagnostic or therapeutic procedures.
Example of SSEA-4 drop-in on undifferentiated H9s

The following is an example of an analysis template showing data from undifferentiated human H9 ES cells that were stained with the kit antibodies plus FITC anti-SSEA-4, a pluripotency surface marker for hESCs (Catalog No. 560126).
Example of FMO control for SSEA-1 drop-in on differentiating H9s

The following is an example of an analysis template showing data from Day 3, differentiating human H9 ES cells that were treated with retinoic acid (10 µM) for 3 days and then stained with the kit antibodies plus mIgM FITC (the matching isotype for FITC anti-SSEA-1).
Example of SSEA-1 drop-in on differentiating H9s

The following is an example of an analysis template showing data from Day 3, differentiating human H9 ES cells that were treated with retinoic acid (10 µM) for 3 days and then stained with the kit antibodies plus FITC anti-SSEA-1, a marker for differentiation of hESCs (Catalog No. 560127).

# Troubleshooting

These are the actions we recommend you take if you encounter the following specific problems.

<table>
<thead>
<tr>
<th>Problem</th>
<th>Recommended actions</th>
</tr>
</thead>
<tbody>
<tr>
<td>Too few events during acquisition</td>
<td>Try one or more of the following:</td>
</tr>
<tr>
<td></td>
<td>- Start with $1 \times 10^6$ cells per tube (some cell loss is expected during washes).</td>
</tr>
<tr>
<td></td>
<td>- Centrifuge at a higher speed.</td>
</tr>
<tr>
<td></td>
<td>- Centrifuge for a longer period of time.</td>
</tr>
<tr>
<td></td>
<td>- Aspirate gently after centrifugation to avoid disturbing the cell pellet.</td>
</tr>
<tr>
<td></td>
<td>- See the user’s guide for your flow cytometer.</td>
</tr>
<tr>
<td>Dim staining of drop-in conjugates</td>
<td>Try one or more of the following:</td>
</tr>
<tr>
<td></td>
<td>- Stain and record data the same day you fix and permeabilize the cells.</td>
</tr>
<tr>
<td></td>
<td>- Stain fresh cells with your drop-in conjugate and compare staining of fresh cells with staining of fixed and permeabilized cells (to determine whether fixing and permeabilizing has a deleterious effect on staining).</td>
</tr>
<tr>
<td></td>
<td>- Increase the staining time to 1 hour at room temperature.</td>
</tr>
<tr>
<td></td>
<td>- Increase the amount of fluorescent antibody.</td>
</tr>
<tr>
<td></td>
<td>- For surface-marker drop-ins, ensure that you use an appropriate detachment reagent to harvest cells so that epitopes on the cell surface are not destroyed.</td>
</tr>
<tr>
<td></td>
<td>- Make sure to mix well after adding antibody conjugate to the tube.</td>
</tr>
</tbody>
</table>

**Examples of bead and cell placement**

**Example with hESCs**

The following plot shows BD CompBead Plus beads run together with a single-cell suspension of fixed cells from the H9 hESC line.
About spectral overlap and compensation

**Spectral overlap**

The spectral overlap values for a given fluorochrome are the fluorescence values above background in all detectors relative to the primary detector for that fluorochrome.

For example, the fluorescence of a PE-stained sample is defined as 100% in the PE detector, and its spectral overlap values could be up to 1% in the FITC detector, and up to 20% in the APC or Alexa Fluor® 647 detector.

**Compensation**

Compensation is the process by which spectral overlap is removed so that the fluorescence value for a parameter reflects only the fluorescence in the primary detector.

To calculate compensation, the spectral overlap values are measured for each of the fluorochromes to be used in an experiment.
