The BD Stemflow™ Mouse Hematopoietic Stem and Progenitor Cell Isolation Kit provides a comprehensive research system for the reliable, high purity isolation of hematopoietic progenitor and stem cells (HPCs and HSCs) from bone marrow.

The ready-to-use kit reduces experiment complexity and improves dependability by integrating many of the relevant materials and methods required for cell sorting by flow cytometry. These components include fluorochrome conjugated monoclonal antibodies to markers for HSCs, progenitors, and mature hematopoietic cells, as well as compensation beads, verified protocols, and software and analysis guidelines.

To provide flexibility to explore alternative HSC enrichment options, an open design offers compatibility with side population analysis and magnetic enrichment, as well as the easy addition of supplementary antibodies.

**Multicolor flow cytometry for in-depth analysis**
By capitalizing on flow cytometry’s powerful capabilities for single-cell sorting based on the classical KLS (c-Kit+ Lin- Sca-1+) cell surface markers, the isolation kit delivers optimal purity for isolating multipotent long-term HSC (LT-HSC), short-term HSC (ST-HSC), or multipotent progenitor (MPP) subpopulations from heterogeneous bone marrow cells.

**A comprehensive system for simplified, consistent setup**
To improve productivity and reduce assay-to-assay variability, the kit contains pre-titrated, pre-conjugated monoclonal antibodies to cell surface markers for self-renewal (c-Kit PE, Sca-1 PE-Cy™7), a marker for progenitors (CD34 FITC), and a cocktail of markers for the hematopoietic lineage (APC Lineage Cocktail). To further streamline the isolation process, Mouse BD Fc Block™, 7-AAD vital dye, and isotype controls are also provided.

BD™ CompBead microparticles simplify and standardize experimental setup by facilitating compensation for multicolor analysis.

Optimized protocols and guidelines for processing, sorting, and recovering cells using BD flow cytometry instruments and software provide easy-to-follow guidance and standardization.
BD Stemflow Mouse Hematopoietic Stem and Progenitor Cell Isolation Kit

Modular and open to accommodate specific needs
For simple customization and more advanced analysis, the open, modular architecture of the kit allows for the easy addition of supplementary fluorochrome conjugated monoclonal antibodies against critical cell-surface markers. BD CompBead microparticles can also be used as compensation controls for additional antibody drop-ins to this kit. This is particularly useful when testing for markers that might or might not be expressed on cells of interest.

The kit is compatible with side population staining to further enrich for LT-HSCs. In addition, upfront magnetic bead enrichment can be used for preparative applications.

A resource for stem cell research
BD Biosciences continues to support innovation in the area of stem cell research with more than 20 years of experience in the field. Inspired by in-depth understanding of the complexities of biological experiments, the BD Stemflow Mouse Hematopoietic Stem and Progenitor Cell Isolation Kit is designed to make it easier for researchers to obtain accurate results, increase research productivity, and accelerate discoveries.

BD Stemflow Mouse Hematopoietic Stem and Progenitor Cell Isolation Kit contents

- **Monoclonal Antibodies**
  - Mouse c-Kit (CD117) PE
  - Mouse CD34 FITC
  - Mouse Sca-1 PE-Cy7
  - Mouse APC Lineage Cocktail

- **Isotype Controls and Other Staining Tools**
  - Rat IgG₂β, κ Isotype Control PE
  - Rat IgG₂α, κ Isotype Control FITC
  - Rat IgG₂α, κ Isotype Control PE-Cy7
  - Rat/Hamster Isotype Control Cocktail APC
  - Purified Rat Anti-Mouse CD16/CD32 (Mouse BD Fc Block™)
  - 7-AAD vital dye

- **Flow Cytometry Compensation Beads**
  - BD™ CompBead Plus Anti-Rat/Hamster Ig, κ

- **Protocols and Analysis Guidelines**
  - Protocol for cell sorting and recovery
  - Protocol for analysis, including creating BD FACSDiva™ templates

Figure 2. Cobblestone forming and colony forming assays on sorted cells.
Flow cytometry sorted HSCs and HPCs were plated in a cobblestone forming assay (a surrogate LT-HSC assay) for 3 weeks. Images were taken at multiple time points. The characteristic cobblestone pattern was observed (Figure 2A). To show that the cobblestone cells had multilineage potential, they were further plated in a colony forming assay. Colonies were imaged after 12 days (Figures 2B and 2C).
